Github copilot is an Ai pair programmer that we built to help you red the joy and creativity of coding. By drying context from comments and code, c copilot suggests individual lines and whole functions instantly. It's currently available as an extension for Neo Vs code, visual studio, and the family of jet brain Ease. C copilot handles low level tasks and common problems like scaffolding new code and Apis, building regular expressions or even working an unfamiliar programming language. C pilot helps you stay in the flow by quickly offering a variety of suggestions, new paths, and ideas for new frameworks. This lets you spend less time on boiler plate and repetitive code patterns and more time building great software. C copilot works for all major programming languages and is intelligent enough to adapt to your personal style over time. It can even help you learn new programming languages. To learn more, check out this link. Now a only c pilot could suggest a cool way to end this video. Oh, oh, that's not bad. A Oh, m. Oh, that is the one right there.
